Technological achievements

Reconstruction: from kludge to normal operation design

HW, control and web presentation SW (python), database oriented analysis (SQL), WIKI (gitit).

- Vertical stabilization.
- Plasma breakdown with 2.45 GHz MW launcher.
- Bottom and top preionization gunn instalation (breakdown studies).

Vertical plasma stabilization

4 Mirnov coils at poloidal angles. Computer with real-time OS for calculating the plasma position with a frequency of 50 kHz. Voltage source driven by the computer controls a current in a poloidal coils. The prolongation of the plasma life was over 2 ms.

Breakdown optimization with the 2.45 GHz MW launcher

Focused topics: MHD studies

Array of 16 Mirnov coils has been installed. Magnetic islands detected at low q regime of tokamak $m = 3$ magnetic island – shown by cross-correlation analysis of 14 – 15 ms interval

Spectrogram of B_θ perturbations detected by a Mirnov coil located on $\theta = \pi/2$, Cross-correlation coefficients of B_θ perturbation signal on an array of 16 Mirnov coils. Reference coil chosen on $\theta = \pi/2$
