

Tomography study on GOLEM tokamak

Fabien Marguet
Supervisor : Michal Odstrcil

Basic principle

Minimum Fisher regularization also called Tikhononov regularization

We solve the following equation :

$$(T_s' * f_s) x - TT + \lambda H = 0$$

Which is of the form $ax + b = 0$

The solution is then :

$$x = \frac{(TT + \lambda H)}{T_s' * f_s}$$

with λ being a constant that we chose at 10^9 because a higher value doesn't give a better result and the calculation time always stays low.

Plasma parameters

$$\Delta t = 11.4 \text{ ms}$$

$$I_p = 4.47 \text{ kA}$$

$$U_{IBD} = 10.5 \text{ V}$$

$$U_i = 9.06 \text{ V}$$

$$T_e = 35.7 \text{ eV}$$

$$P_{OH} = 40.50 \text{ kW}$$

$$Q_{ed} = 2.1$$

Experimental setup

Horizontal position

Vertical position

Plasma reconstruction

Polished tomography

Time 0.009 Chi2= 0.99 converged: True

Conclusion

- We are able to compare results from different diagnostics (e.g. cameras and magnetics)
- We are able to reconstruct a cross section of the plasma
