backslashnewline#Descriptionbackslashnewline
In a special event called the Global Tokamak Experiment, using
a web based system, over 4 hours 38 participants from 10 different countries carried out 83 plasma discharges. Due to the
global nature of this experiment a security feature using access keys (also referred to as tokens) were distributed to limit the usage of
the tokamak. A login based system identified between participant, and experiment manager. Thus the machine was based
in the Czech Republic, the experiment manager in the UK, and the participants in many other countries.backslashnewline#Gallerybackslashnewline

*It was great! . . . Many thanks to Billy for the excellent site design and
to Vojtech Svoboda and his team for the interesting
experiment. I hope that it will ever happen again. I and another student
has already been discussed the results of shots yesterday the whole
evening and today, a good idea to make the discussion more global=D.</> <p
