# Milestones to Fusion Power Plant

# Education importance

Let's start with the tokamak GOLEM - *the smallest tokamak in the World with the biggest control room*

# The GOLEM tokamak basic characteristics

*The grandfather of all tokamaks (ITER newslines 06/18)*

- Vessel major radius:  $R_0 = 0.4$  m
- Vessel minor radius:  $r_0 = 0.1$  m
- Maximum plasma current:  
 $I_p^{\max} < 8$  kA
- Maximum toroidal magnetic field:  $B_t^{\max} < 0.5$  T
- Typical electron density:  
 $\langle n_e \rangle \in (0.2, 3) \cdot 10^{19} \text{ m}^{-3}$
- Maximum electron temperature:  
 $T_e^{\max} < 80$  eV
- Maximum discharge duration:  
 $\tau_p^{\max} < 25$  ms

## Tokamak

From Wikipedia, the free encyclopedia

*This article is about the fusion reaction device. For other uses, see [Tokamak \(disambiguation\)](#).*

A **tokamak** (Russian: **токамак**) is a device that uses a powerful magnetic field to confine plasma in the shape of a torus. Achieving a stable plasma equilibrium requires magnetic field lines that wrap around the torus in a helical shape. Such a helical field can be generated by adding a toroidal field

it decays into a proton and electron with the emission of energy. When the time comes to actually try to make electricity from a tokamak-based reactor, some of the neutrons produced in the fusion process would be absorbed by a liquid metal blanket and their kinetic energy would be used in heat-transfer processes to ultimately turn a generator.

### Experimental tokamaks [[edit](#)]

#### Currently in operation [[edit](#)]

(in chronological order of start of operations)

- 1960s: TM1-MH (since 1977 Castor; since 2007 Golem<sup>[122]</sup>) in Prague, Czech Republic. In operation in Kurchatov Institute since early 1960s but renamed to Castor in 1977 and moved to IPP CAS,<sup>[131]</sup> Prague; in 2007 moved to FNSPE, Czech Technical University in Prague and renamed to Golem.<sup>[14]</sup>
- 1975: T-10, in Kurchatov Institute, Moscow, Russia (formerly Soviet Union); 2 MW
- 1983: Joint European Torus (JET), in Culham, United Kingdom
- 1985: JT-60, in Naka, Ibaraki Prefecture, Japan; (Currently undergoing upgrade to Super, Advanced model)
- 1987: STOR-M, University of Saskatchewan; Canada; first demonstration of alternating current in a tokamak.
- 1988: Tore Supra,<sup>[15]</sup> at the CEA, Cadarache, France
- 1989: Aditya, at Institute for Plasma Research (IPR) in Gujarat, India
- 1980s: DIII-D,<sup>[16]</sup> in San Diego, USA; operated by General Atomics since the late 1980s
- 1989: COMPASS,<sup>[13]</sup> in Prague, Czech Republic; in operation since 2008, previously operated from 1989 to 1999 in Culham, United Kingdom
- 1990: FTU, in Frascati, Italy
- 1991: Tokamak ISTTOK,<sup>[17]</sup> at the Instituto de Plasmas e Fusão Nuclear, Lisbon, Portugal;
- 1991: ASDEX Upgrade, in Garching, Germany

# GOLEM

... somewhere, in the ancient cellars of Prague,

*there is hidden indeed "infernal" power. Yet it is the very power of celestial stars themselves. Calmly dormant, awaiting mankind to discover the magic key, to use this power for their benefit. . .*

At the end of the 16th century, in the times when the Czech lands were ruled by Emperor Rudolf II, in Prague, there were Rabbi Judah Loew, well known alchemist, thinker, scholar, writer and inventor of the legendary GOLEM - a clay creature inspired with the Universe power that pursued his master's command after being brought to life with a shem, . Golem is not perceived as a symbol of evil, but rather as a symbol of power which might be useful but is very challenging to handle. To learn more of the Golem legend, see e.g. [1].

# The GOLEM tokamak mission

# Towards ... Energy confinement time

## House

## Tokamak

- Net power = Efficiency  $\times$  (Fusion - Radiation loss - Conduction loss)
- The confinement time:  $\tau_E = \frac{W}{P_{\text{loss}}}$
- Energy density  $W = 3nk_B T$  & rate of radiation and conduction energy loss per unit volume  $P_{\text{loss}}$
- Reactions per volume per time of fusion reactions is:  
 $f = n_d n_t \langle \sigma v \rangle = \frac{1}{4} n^2 \langle \sigma v \rangle$
- Fusion heating  $fE_{\text{ch}}$ , where  $E_{\text{ch}} = 3.5 \text{ MeV}$  should exceed the losses:  
 $fE_{\text{ch}} \geq P_{\text{loss}}$

$$n\tau_E \geq L \equiv \frac{12}{E_{\text{ch}}} \frac{k_B T}{\langle \sigma v \rangle} \geq 1.5 \cdot 10^{20} \frac{\text{s}}{\text{m}^3}$$

(DT reaction @ minimum  $\approx 26 \text{ keV}$ )

# Basic diagnostics - numerical processing, raw data

The image shows a web browser displaying a diagnostics interface for a Golem system. The top part of the browser shows a graph with a blue line and a red vertical line. Below the graph is a navigation menu with sections like 'Diagnostics', 'Other', and 'Navigation'. The main content area is titled 'On stage diagnostics' and features a flow diagram with stages: 'Data flow', 'measurement', 'digitization', and 'analysis'. A red circle highlights a specific icon in the 'analysis' stage. Below the browser window is a file index for the directory '/shots/39187/Devices/Oscilloscopes/TektrMSO56-a'. The index table lists files such as 'BasicDiagnostics.sh', 'ScreenShotAll.png', 'TektrMSO56\_ALL.csv', 'Universals.sh', 'das.jpg', 'ls-all', and 'rawdata.jpg'. A red arrow points from the highlighted icon in the browser to the 'BasicDiagnostics.sh' file in the index. Another red arrow points from the left side of the image to the 'BasicDiagnostics.sh' file.

Index of /shots/39187/Devices/Oscilloscopes/TektrMSO56-a

# Basic diagnostics - numerical processing, Jupyter-notebook@GitLab Download & play

The image shows a browser window displaying a GitLab repository page for 'Tokamak GOLEM Basic diagnostics'. The top navigation bar includes 'About GitLab', 'Pricing', 'Talk to an expert', and a search bar. The left sidebar shows repository navigation options like 'Project information', 'Repository', 'Files', 'Commits', 'Branches', 'Tags', 'Contributors', 'Graph', 'Compare', 'Locked Files', 'Issues', 'Merge requests', 'CI/CD', 'Deployments', and 'Collapse sidebar'. The main content area shows the notebook 'StandardDAS.ipynb' (19.83 KIB) with a blue 'Open in Web IDE' button. The notebook title is 'Tokamak GOLEM Basic diagnostics'. Below the title, there is a 'Procedure' section with a link '(This notebook to download)'. The 'Prerequisites: function definitions' section lists 'Load libraries' with the following code:

```
%matplotlib inline
import os
import numpy as np
import matplotlib.pyplot as plt
from scipy import constants, integrate, signal, interpolate
import sqlalchemy # high-level library for SQL in Python
import pandas as pd
import subprocess
```

A red arrow points from a circled icon in the notebook preview (top right) to the notebook title.

# Basic diagnostics - numerical processing, Jupyter-notebook applied on the Discharge #

Procedure ([This notebook to download](#))

[bash wrapper](#), [Error log](#)

## Prerequisites: function definitions

Load libraries

```
In [1]: %matplotlib inline
import os
import numpy as np
import matplotlib.pyplot as plt
from scipy import constants, integrate, signal, interpolate
import sqlalchemy # high-level library for SQL in Python
import pandas as pd
import subprocess
```

For interactive web figures

```
In [2]: import holoviews as hv
hv.extension('bokeh')
import hvplot.pandas
```

For conditional rich-text boxes

```
In [3]: from IPython.display import Markdown
```

# Loop voltage $U_l$ @ the GOLEM tokamak

# Basic diagnostics - numerical processing, $U_{loop}$

```
t_scale = 1e-3 if in_seconds else 1
if is_plasma:
    for t in (t_plasma_start, t_plasma_end):
        plt.axvline(t = t_scale, color='k', linestyle='--')
```

## $U_l$ management

Check the data availability

```
In [11]: loop_voltage = read_signal(shot_no, 'U_Loop')
polarity_CD = read_parameter(shot_no, 'CD_orientation')
if polarity_CD != 'CW': # T000 hardcoded for now!
    loop_voltage *= -1 # make positive
loop_voltage = correct_inf(loop_voltage)
loop_voltage.loc[is_CD] = 0
ax = loop_voltage.plot(grid=True)
show_plasma_limits()
ax.set(xlabel='Time [s]', ylabel='SU_LS [V]', title='Loop voltage SU_LS #{}'.format(shot_no));
```

```
Out[11]: [Text(0.5, 0, 'Time [s]'),
Text(0, 0.5, 'SU_LS [V]'),
Text(0.5, 1.0, 'Loop voltage SU_LS #39187')]
```

## $B_t$ calculation

Check the data availability

It is as magnetic measurement, so the raw data only give  $\frac{dB_t}{dt}$

```
In [12]: dBt = read_signal(shot_no, 'U_BtCoil')
polarity_BT = read_parameter(shot_no, 'BT_orientation')
if polarity_BT != 'CW': # T000 hardcoded for now!
    dBt *= -1 # make positive
dBt = correct_inf(dBt)
dBt -= dBt.loc[offset_s1].mean()
ax = dBt.plot(grid=True)
show_plasma_limits()
ax.set(xlabel='Time [s]', ylabel='dBt [V]', title='BTCoil raw signal #{}'.format(shot_no));
```

# Toroidal magnetic field $B_t$ @ the tokamak GOLEM

# Basic diagnostics - numerical processing, $B_t$

## $B_t$ calculation

### Check the data availability

It is as magnetic measurement, so the raw data only give  $\frac{dB_t}{dt}$

```
In [12]: dBt = read_signal(shot_no, '0_BtCoil')
polarity_Bt = read_parameter(shot_no, 'Bt_orientation')
if polarity_Bt != 'CW':
    dBt *= -1 # make positive # 1000 hardcoded for now!
dBt = correct_infidBt
dBt = dBt.loc[offset_start:offset_end]
ax = dBt.plot(grid=True)
show_plasma_limits()
ax.set(xlabel='Time [s]', ylabel='dBt [B/s]', title='BtCoil_raw signal #{}'.format(shot_no));
```

```
Out[12]: [Text(0.5, 0, 'Time [s]'),
Text(0, 0.5, 'dBt [B/s]', title='BtCoil_raw signal #39187')]
Text(0.5, 1.0, 'BtCoil_raw signal #39187')]
```

### Integration (it is a magnetic diagnostic) & calibration

```
In [13]: K_BtCoil = float(read_parameter(shot_no, 'SystemParameters/K_BtCoil')) # Get BtCoil calibration factor
print('BtCoil calibration factor K_BtCoil: {} T/(Vs)'.format(K_BtCoil))
BtCoil calibration factor K_BtCoil=70.42 T/(Vs)
```

```
In [14]: BT = pd.Series(integrate.cumtrapz(dBt, axis=dBt.index, initial=0) * K_BtCoil,
index=dBt.index, name='Bt')
ax = BT.plot(grid=True)
show_plasma_limits()
ax.set(xlabel='Time [s]', ylabel='Bt [T]', title='Toroidal magnetic field Bt ts #{}'.format(shot_no));
```

```
Out[14]: [Text(0.5, 0, 'Time [s]'),
Text(0, 0.5, 'Bt [T]', title='Toroidal magnetic field Bt ts #39187')]
Text(0.5, 1.0, 'Toroidal magnetic field Bt ts #39187')]
```

# Total current $I_{ch+p}$

# Basic diagnostics - numerical processing, $U_{ch+p}$

Chamber (+ Plasma) current  $I_{p+ch}$  calculation

The Rogowski coil around the chamber measures the total current contained within its boundaries. Therefore, if there is plasma, it measures the sum of the plasma and chamber currents. In a vacuum discharge it measures only the chamber current.

Check the data availability

Because it is a magnetic measurement, the raw data only gives  $\frac{dI}{dt}$

```
In [131]: dIpcch = read_signal(shot_no, 'RogCoil') # 5000 horizontal for now
if dIpcch[0] == 0:
    dIpcch *= 1 # zero sensitive
dIpcch = correct_bias(dIpcch)
dIpcch = dIpcch[scf(First_s), None] # subtract offset
dIpcch[0] = 0
ax = dIpcch.plot(grid=True)
show plasma limits()
ax.set(xlabel='Time [s]', ylabel='dI/dt [A/s]', title='RogowskiCoil_raw signal_#131'.format(shot_no))
```

Integration (it is a magnetic diagnostic) & calibration

```
In [130]: K_RogowskiCoil = float(read_parameter(shot_no, 'SystemParameters/K_RogowskiCoil')) # Get RogowskiCoil calibration factor
print('RogowskiCoil calibration factor: K_RogowskiCoil={0:10.6} A/(V/s)'.format(K_RogowskiCoil))
In [132]: Ipcch = pd.Series(integrate.cumtrapz(dIpcch, x=dIpcch.index, initial=0) * K_RogowskiCoil,
                          x=dIpcch.index, name='Ipcch')
ax = Ipcch.plot(grid=True)
show plasma limits()
ax.set(xlabel='Time [s]', ylabel='I [pA] [A]', title='Total (plasma+chamber) current_#131'.format(shot_no))
```

Chamber current  $I_{ch}$  calculation

```
In [130]: R_chamber = float(read_parameter(shot_no, 'SystemParameters/R_chamber')) # Get Chamber resistivity
print('Chamber resistivity R_chamber={0}'.format(R_chamber))
Chamber resistivity R_chamber=0.007 Ohm
In [131]: L_chamber = float(read_parameter(shot_no, 'SystemParameters/L_chamber')) # Get Chamber inductance
print('Chamber inductance L_chamber={0}'.format(L_chamber))
Chamber inductance L_chamber=4e-06 H

# GNU Wget

GNU Wget is a free software package for retrieving files using HTTP, HTTPS and FTP, the most widely-used Internet protocols. It is a non-interactive commandline tool, so it may easily be called from scripts, cron jobs, terminals without X-Windows support, etc.

- Runs on most UNIX-like operating systems as well as Microsoft Windows.
- Homepage: <http://www.gnu.org/software/wget/>
- Basic usage:
  - To get  $U_l$ : `wget http://golem.fjfi.cvut.cz/utis/data/<#ShotNo>/loop_voltage`
  - To get whole shot: `wget -r -nH -cut-dirs=3 -no-parent -l2 -Pshot http://golem.fjfi.cvut.cz/shots/<#ShotNo>`

# Excel

File→Open→

`http://golem.fjfi.cvut.cz/utils/data/<#ShotNo>/<identifier>`

# Energy balance of the tokamak

## Energy confinement time

Under the assumption of a simplified power balance, the heating power  $P_H$  is partially absorbed in the plasma and leads to an increase of the plasma energy  $W_p$  and the rest is lost as the loss power  $P_{Loss}$

$$P_H = \frac{dW_p}{dt} + P_{Loss}$$

The energy confinement time is defined as the characteristic time scale of the exponential decay of the plasma energy  $W_p$  due to the loss power  $P_{Loss}$ :

$$\tau_E = \frac{W_p}{P_{Loss}} = \frac{W_p}{P_H - dW_p/dt}$$

Choosing the quasistationary phase of the plasma discharge, where  $\frac{dW_p}{dt} = 0$  gives:

$$\tau_E(t) = \frac{W_p(t)}{P_H(t)}$$

# The discharge - quasistationary phase

## Plasma heating power

On the GOLEM tokamak the only heating mechanism of the plasma is ohmic heating  $P_{OH}$  resulting from the plasma current  $I_p$  flowing in a conductor with finite resistivity  $R_p$ . The time dependence of the ohmic heating power can be calculated as:

$$P_H(t) = P_{OH}(t) = R_p(t) \cdot I_p^2(t)$$

# Plasma Energy

The global plasma energy content  $W_p$  can be simply calculated from the temperature estimation  $T_e(0, t)$ , average density  $n_e$  and plasma volume  $V_p$ , based on the ideal gas law, taking into account the assumed

$T_e(r, t) = T_e(0, t) \left(1 - \frac{r^2}{a^2}\right)^2$  temperature profile:

$$W_p(t) = V_p \frac{n_e k_B T_e(0, t)}{3}.$$

The information that the magnetic field reduces the degrees of freedom of the particles to two has been used to derive this formula.

- $V_p \approx 80 \text{ l}$

## Central Electron Temperature estimation (Spitzer Formula)

The time evolution of the central electron temperature  $T_e(0, t)$  is calculated from equation based on Spitzer's resistivity formula (see eg. [5],[6]):

$$T_e(0, t) = \left( \frac{R_0}{a^2} \frac{8Z_{eff.}}{1544} \frac{1}{R_p(t)} \right)^{2/3}, [eV; m, \Omega]$$

For particular case of the GOLEM tokamak it says:

$$T_e(0, t) = 0.9 \cdot \left( \frac{I_p(t)}{U_I(t)} \right)^{2/3}, [eV; A, V]$$

- A voltage to charge the Current drive field  $E_t$  capacitor:  $U_{E_t}$  [V]  $< 400, 700 >$  V
- A voltage to charge the Toroidal magnetic field  $B_t$  capacitor:  $U_{B_t}$  [V]  $< 600, 1200 >$  V
- Time delay of the  $E_t$  trigger with respect to the  $B_t$  trigger:  $T_{CD}$  [ $\mu$ s]  $< 0, 10000 >$   $\mu$ s

# Fee: postcard from the venue of remote measurements

# Acknowledgement

## Financial support highly appreciated:

CTU RVO68407700, SGS 17/138/OHK4/2T/14, GAČR GA18-02482S, EU funds CZ.02.1.01/0.0/0.0/16\_019/0000778 and CZ.02.2.69/0.0/0.0/16\_027/0008465, IAEA F13019, FUSENET and EUROFUSION.

## Students, teachers, technicians (random order):

Vladimír Fuchs, Ondřej Grover, Jindřich Kocman, Tomáš Markovič, Michal Odstrčil, Tomáš Odstrčil, Gergo Pokol, Igor Jex, Gabriel Vondrášek, František Žáček, Lukáš Matěna, Jan Stockel, Jan Mlynář, Jaroslav Krbec, Radan Salomonovič, Vladimír Linhart, Kateřina Jiráková, Ondřej Ficker, Pravesh Dhyani, Juan Ignacio Monge-Colepicolo, Jaroslav Čerovský, Bořek Leitl, Martin Himmel. Petr Švihra, Petr Mácha, Vojtěch Fišer, Filip Papoušek, Sergei Kulkov, Martin Imříšek.

Place the discharge setup into the queue.

# Table of Contents

- 1 Introduction
- 2 The Tokamak (GOLEM)
- 3 The Tokamak GOLEM (remote) operation
- 4 The Electron energy confinement time calculation (rough estimation)
- 5 Conclusion
- 6 Appendix**
